Example 11; Page -; 61pp; English. New polypeptide, which binds to the the treatment of hard tumors -WPI; 2001-529934/58 extracellular domain of HER-2 for

The invention relates to novel HER-2 (herstatin-2) antagonist

containing a polypeptide that binds to the extracellular domain (ECD)

conf HER-2 at a site that is different from the binding site of humanised

antibody, Herceptin, at an affinity of at least 10°8. The present

invention is based upon the initial discovery of an alternative HER-2

many transcript with 274 bp insert of intron 8. The translation product

of the alternative transcript is a truncated HER-2 protein designated

possented by the contains ECD I, II of the pl85HER-2 and the novel ECDIIIa.

The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise

the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the

containing ECDIIIa versant sequence is human p68HER-2 generic protein

containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181).

Title: Perfect score: Sequence:

8)

US-09-506-079E-2
419
1 MELAALCRWGLLLALLPPGA.....VGRGXDPDAHVAVXLSRYEG 419

Scoring table:

OLIGO Gapop 60.0 , Gapext 60.0

Searched: 112892 seqs, 41476328 residues

Word size : 0

Total number of hits satisfying chosen parameters: 112892

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Listing first 45 summaries

SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESIDUES (BY SIMILARITY).

POLYMORPHISM: THERE ARE FOURS ALLELES DUE TO THE VARIATIONS IN POSITIONS 654 AND 655. ALLELE B1 (654-ILE-ILE-655) HAS A FREQUENCY OF 0.782; ALLELE B2 (654-ILE-VAL-655) HAS A FREQUENCY OF 0.206; ALLELE B3 (654-VAL-VAL-655) HAS A FREQUENCY OF 0.012.

SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              European Bioinformatics Institute.

Rev. Biochem. 56:881-914(1987).

FUNCTION: Receptor for EGF, but also for other members of the Enfamily, as TGF-alpha, amphiregulin, betacellulin, heparin-bindin EGF-like growth factor, GP30 and vaccinia virus growth factor. Involved in the control of cell growth and differentiation.

FUNCTION: Isoform 2/truncated isoform may act as an antagonist.

CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                   MISCELLANEOUS: Binding of EGF to the receptor lead dimerization, internalization of the EGF-receptor induction of the tyrosine kinase activity, stimula

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Submitted (FEB-2001) to the EMBL/GenBank/DDBJ databases.
--- FUNCTION: May be a signaling adaptor molecule involved in p75NTR-mediated apoptosis induced by NGF. May play an important role in the pathogenesis of neurogenetic diseases.
---- SUBUNIT: Binds to the DEATH domain of p75NTR/NGFR.
---- TISSUE SPECIFICITY: FOUND IN OVARIAN GRANULOSA CELLS, TESTIS,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDITINE=20298829; PubMed=10764727;

A; Accession: A44290
A; Molecule type: protein
A; Residues: 20-36 <ROU>
C; Comment: KCAM mediates cell-cell adhesion via homophilic binding with another NCAM mol.
C; Comment: Several forms of NCAM are produced by alternative splicing. See also PIR:IJMS
C; Genetics:
A; Map position:
C; Superfamily: neural cell adhesion molecule; fibronectin type III repeat homology; immu
C; Keywords: alternative splicing; cell adhesion; duplication; heparin binding; membrane
F; 1-19/Domain: immunoglobulin homology <IMM1>
F; 132-19/Domain: signal sequence #status predicted <SIG>
F; 152-156/Region: heparin binding #status predicted
F; 21-156/Region: heparin binding #status predicted
F; 228-290/Domain: immunoglobulin homology <IMM3>
F; 63-272/Region: NCAM binding #status predicted
F; 228-290/Domain: immunoglobulin homology <IMM4>
F; 420-482/Domain: immunoglobulin homology <IMM3>
F; 420-482/Domain: immunoglobulin homology <IMM4>
F; 420-482/Domain: immunoglobulin homology <IMM5>
F; 420-482/Domain: immunoglobulin homology <IMM
                                                                                                                                                                                                      A; Nolecule type: mRNA
A; Residues: 340-381 <SM2>
A; Residues: 340-381 <SM2>
